VaR Introduction II: Historical VaR

Historical VaR
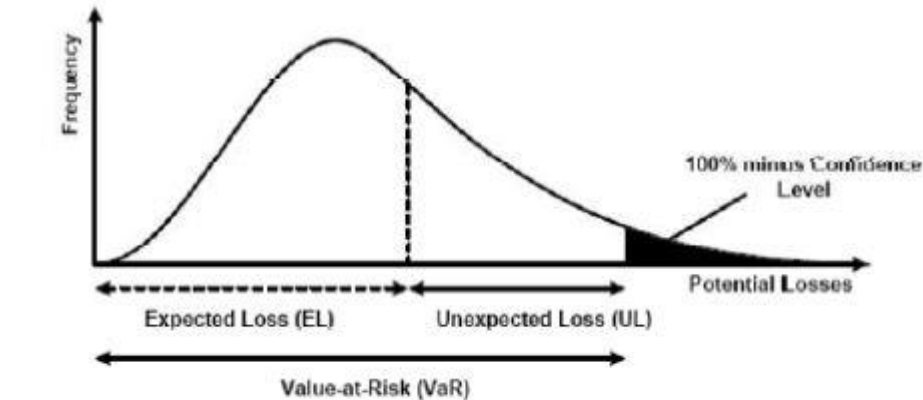

Summary

- VaR Definition
- VaR Roles
- VaR Pros and Cons
- VaR Approaches
- Historical VaR
- Historical VaR Methodology and Implementation
- VaR Scaling
- VaR Backtest

Value at Risk (VaR) Definition

◆ The maximum likely loss on a portfolio for a given probability defined as *x%* confidence level over N days

◆ Pr(*Loss* > *VaR*(*x%*)) < 1- *x%*

VaR Roles

- ◆ Risk measurement
- ◆ Risk management
- ◆ Risk control
- ◆ Financial reporting
- ◆ Regulatory and economic capital

VaR Pros & Cons

- Pros
  - Regulatory measurement for market risk
  - Objective assessment
  - Intuition and clear interpretation
  - Consistent and flexible measurement

- Cons
  - Doesn't measure risk beyond the confidence level: tail risk
  - Non sub-additive

Three VaR Approaches

◆ Parametric VaR

◆ Historical VaR

◆ Monte Carlo VaR

The presentation focuses on historical VaR.

Historical VaR

- ◆ Assumption

  - The past is a good indicator of the near-future or history repeats itself

- ◆ Pros

  - ◆ Simple and intuitive
  - ◆ Easy back and stress test
  - ◆ No distribution assumption
  - ◆ No calibration

- ◆ Cons

  - ◆ Poor accuracy for higher confidence level and tail risk
  - ◆ Difficult for long horizons
  - ◆ Limited scenario

Historical VaR Methodology and Implementation

◆ Obtain one year historical value time series of all market factors, such as a stock price time series is $\bar{x}_1 \quad \cdots \quad \bar{x}_{251}$

◆ Assuming today's value is x_0, generate 250 historical scenarios. The i-th is $x_i = (\bar{x}_i / \bar{x}_{i-1} - 1)x_0$

◆ Compute base PV at today t as $P(x_o)$

◆ Compute 250 scenario PVs: $P(x_i)$

◆ Compute 250 scenario P&L: $P(x_i) - P(x_0)$

◆ Sort 250 scenario P&L. The VaR is the average between 2nd and 3rd lowest (negative) numbers

VaR Scaling

◆ Normally firms compute 1-day 99% VaR

◆ Regulators require 10-day 99% VaR

◆ Under IID assumption, 10-day VaR = $\sqrt{10} * VaR_{1-day}$

VaR Backtest

◆ The only way to verify a VaR system is to backtest

◆ At a certain day, compute hypothetic P&L. If (hypothetic P&L > VaR) ➔ breach, otherwise, ok

◆ Hypothetic P&L is computed by holding valuation date and portfolio unchanged

◆ In one year period,

   ◆ If number of breaches is 0-4, the VaR system is in Green zone
   ◆ If number of breaches is 5-9, the VaR system is in Yellow zone
   ◆ If number of breaches is 10 or more, the VaR system is in Red zone

Thanks!
